Anaesthetization has been planned for the following operation / treatment / examination:
[Die Betäubung ist für die folgende Operation/Behandlung/Untersuchung vorgesehen:]

on (date): [am (Datum):]

Dear Patient, dear parents,

In the interests of eliminating pain during the above medical procedure, your anaesthetist recommends use of one of the following anaesthetic procedures.

The following text is intended to prepare you for your pre-procedure interview with the doctor. During the interview, the doctor will explain to you the advantages and disadvantages of the scheduled anaesthesia procedure compared with alternative methods available, and inform you of any risks specific to your case. The doctor will answer all of your questions in order to reduce any fears or concerns you may have. You may then consent to the anaesthesia procedure suggested to you. Your doctor will provide you with a copy of the completed and signed form after the interview.

THE VARIOUS ANAESTHETIC PROCEDURES

ABLAUF DER VERSCHIEDENEN VERFAHREN

The anaesthetic procedure to be proposed to you will be selected on the basis of a number of factors. These include the level of difficulty, type and anticipated duration of the medical procedure to be performed as well as your general state of health and any diseases, illnesses or disorders that you already have.

During anaesthetization and the entire medical procedure your anaesthetist will continually monitor your vital functions (e.g. blood pressure, heart beat, oxygen saturation) and take immediate action (countermeasures) if there are any problems. It will be possible for your anaesthetist to administer infusions and medications at any time through an indwelling venous cannula that has been inserted in the back of one of your hands or lower arms (venous access).

The anaesthetist will mark the anaesthetic procedure selected for you and discuss it with you in detail.

General Anaesthesia Allgemeinanästhesie (Narkose)

With general anaesthesia medications are administered to the patient to induce and maintain a state that is similar to a deep sleep until the medical procedure being performed is over. The patient loses consciousness and all sensation of pain is eliminated in the patient's entire body.

Before general anaesthesia begins, your anaesthetist will ask you to breathe in oxygen through a mask. Then the anaesthetist will start anaesthetization by injecting a rapidly effective anaesthetic agent into

a vein. This anaesthesia lasts long enough for short medical procedures (**short intravenous anaesthesia**). For longer

medical procedures, the anaesthetist continues the anaesthesia by repeated administration of anaesthetic agents and possibly other medications such as, for example, pain killers and agents for muscle relaxation (**total intravenous anaesthesia**). Sometimes it is necessary to administer gaseous anaesthetic agents or apply artificial respiration (breathing) to the patient after the patient has entered the anaesthetic state. This is done either through a **mask** placed over the patient's mouth and nose, or through a respiration tube that is passed through the mouth or nose and inserted into the wind pipe (**tracheal intubation**), or through a special mask that is passed through the mouth to lie over the entrance of the voice box (**laryngeal mask**).

The anaesthetist will discontinue administration of anaesthetic agents as soon as the medical procedure is over. You will then wake up as if from a deep sleep. The mask, laryngeal mask or respiration tube can be removed as soon as you are able to breathe on your own again. As a rule you will be monitored in the recovery room for a while until it is clear that all of your important organ functions are stable and you are sufficiently alert.

Local Anaesthesia Lokalanästhesie

With some medical procedures it suffices to inject an anaesthetic agent directly into and/or around the site of the procedure in order to eliminate the sensation of pain in this small, restricted area.

Regional Anaesthesia Regionalanästhesie

Regional anaesthesia anaesthetizes (numbs) the nerves which serve the site of the procedure but lie at a distance from it. Then, sensitivity to pain in an entire region of the body is eliminated for a fairly long period of time. During regional anaesthesia you stay awake and are responsive but do not feel any pain.

The anaesthetic agent can be administered in either just one dose or through a catheter (plastic tube) in two or more doses or continually. In certain cases these procedures are combined with each other or with general anaesthesia. A catheter is also

inserted if it will be useful for treating pain effectively after the medical procedure.

Here we describe the most frequently used regional anaesthetic procedures. If a procedure not described here is suitable for you, your anaesthetist will explain it to you.

Spinal Anaesthesia (SPA) Spinalanästhesie (SPA)

This procedure is suitable for anaesthetizing the nerves that lead from the spinal cord to the site of the medical procedure. Nerve segments located in the spinal canal, which is filled with spinal fluid, are blocked by injection of an anaesthetic agent.

The puncture is usually performed while the patient is sitting. In some cases the patient is asked to lie on one side. Either way, you will be told by your anaesthetist to arch your back. The anaesthetist will palpate your back and mark the puncture point (at about waist height). The puncture point area will be thoroughly disinfected and the area around it will be covered sterilely. Then the puncture point area will be locally anaesthetized. It is important that you do not move during the puncture. The anaesthetist will use an introducer needle to insert a very thin spinal needle through the space between two vertebrae into the spinal space next to the spinal cord. The anaesthetist can tell that the tip of this needle has reached the right position when spinal fluid drips out of the needle opening. Then the anaesthetic agent can be injected.

The anaesthetic usually takes effect after a few minutes. First you will experience a feeling of warmth in your legs. Then your sensitivity to pain in the entire lower half of your body will be eliminated and your ability to move your lower body will be restricted or completely suspended.

Epidural Anaesthesia (PDA) Periduralanästhesie (PDA)

lumbular lumbal **thoracic** thorakal

With this procedure the nerves that lead from the spinal cord to the site of the medical procedure are anaesthetized. Nerve segments that pass through the epidural space, which is near the spinal canal, are blocked by injection of an anaesthetic.

The puncture is usually performed while the patient is sitting.

In some cases the patient is asked to lie on one side. Either way, you will be told by your anaesthetist to arch your back. The anaesthetist will palpate your back and mark the puncture point. Depending on the site of the medical procedure, this can be at waist height (lumbular epidural anaesthesia) or the chest spinal column (thoracic epidural anaesthesia). The puncture point area will be thoroughly disinfected and the area around it will be covered sterilely. Then the puncture point area will be locally anaesthetized. It is important that you do not move during the puncture. The anaesthetist will carefully push a hollow needle between two vertebrae into the space near the spinal canal and then use it to carefully introduce a very thin, flexible catheter (epidural catheter). The hollow needle will be removed and an anaesthetic agent will be administered through the catheter.

The anaesthetic agent usually takes effect after 15 to 30 minutes. First you will experience a feeling of warmth in your legs. Then your sensitivity to pain in the area of your chest and/or your abdomen, your lower abdomen and your legs will be eliminated and your ability to move these parts of your body will be restricted or completely suspended.

If the catheter will be needed for treatment of pain after the medical procedure, it will be secured so that it cannot slip and covered with a dressing.

Axillary Brachial Plexus Block Axilläre Plexusanästhesie

The anaesthetist blocks with this procedure the nerve bundle (brachial plexus) that runs from your neck (cervical spine) down to your arm. Herewith, the anaesthetist shuts off pain in your entire arm. This anaesthetic procedure is especially suitable for medical procedures on the hand, lower arm or parts of the upper arm.

The puncture is performed while the patient is lying down. Upon positioning the arm, the anaesthetist will palpate the puncture point in your armpit and mark it. The puncture point area will be thoroughly disinfected, covered with a special sterile drape, and then numbed with a local anaesthetic. It is important that you do not move during the puncture. The anaesthetist will use an injection needle to search for the brachial plexus nerve bundle, which, together with blood vessels, is surrounded by a sheath of tissue. A brief feeling of "pins and needles" is quite normal and no reason at all for you to worry. In order to locate with certainty the bundle of nerves to be anaesthetized, the anaesthetist generally uses a nerve stimulator attached to the needle. The stimulator transmits weak electric impulses to the nerves. These impulses stimulate the nerves and trigger involuntary muscle twitches. This will indicate to the anaesthetist the proper position for the injection needle. The anaesthetic solution will then be injected into the direct vicinity of the nerve bundle. The search for the nerve bundle can also be supported by an ultrasound control.

The anaesthetic agent will take effect after about 10 to 15 minutes. You will first experience a feeling of pressure and warmth in your arm. Then pain will be eliminated from the shoulder region downwards and the ability of your arm to move on its own will be restricted or completely suspended.

For some medical procedures it can be appropriate to apply the anaesthetic above or below the collar bone or at your neck. If one of these procedures is suitable for you, the anaesthetist will explain it to you.

POSSIBLE SUPPLEMENTARY MEASURES

MÖGLICHE ERWEITERUNGSMASSNAHMEN

If you feel disturbed by the atmosphere in the operating room during local or regional anaesthesia, or if the anaesthetist considers this to be necessary, you will be given a light sedative through the venous access. This will cause you to dose off so that you might not be able to remember the entire medical procedure or maybe you won't remember any of it all.

In some cases, the effort to completely eliminate the sensation of pain by means of local or regional anaesthesia is not com-

pletely successful. Then, in addition, a strong pain killer can be administered or another regional anaesthetic procedure can be employed. If, despite all efforts, sufficient anaesthetic effects still cannot be achieved for the anticipated duration of the medical procedure, or if there are other problems, the medical procedure will have to be continued under general anaesthesia.

PREPARATION AND POST-ANAESTHESIOLOGICAL CARE

HINWEISE ZUR VORBEREITUNG UND NACHSORGE

Please strictly follow the instructions of the anaesthetist and his or her assistants. These instructions can vary, depending on the type of anaesthesia and medical procedure.

Preparation:

Medication: Please inform your doctor of any medication you take or inject on a regular basis (in particular any anticoagulant agents such as Aspirin® [ASA], Marcumar®, Heparin, Plavix®, Ticlopidin, Clopidogrel, Eliquis®, Lixiana®, Xarelto®, Pradaxa® and metformin-containing antidiabetic medicines, so-called biguanides) or have taken over the course of the past eight days prior to the procedure (for instance pain killers such as ibuprofen, paracetamol). This includes any over-the-counter medication and herbal remedies. Your doctor will let you know if and for how long you should stop taking your medication.

Food, drink and smoking: In order to prepare for anaesthesia, please only eat light meals on the day before your scheduled procedure. As a matter of principle, nothing should be ingested after 6 hours, if possible 8 hours, before the medical procedure. This prohibition covers not only solid foodstuffs but also soups, sweets, candy and chewing gum as well as beverages such as juices with pulp (fruit or vegetable particles), milk, broths and alcohol. In addition, you may not smoke. Small amounts of clear fluids (e.g. one or two glasses of water or unsweetened tea) are allowed until 2 hours before the start of anaesthesia. Your anaesthetist will give you more precise instructions.

These restrictions must be strictly observed in order to prevent contents of the stomach from passing into the lung. **That is why it is very important that you tell your anaesthetist before the medical procedure starts if you were not able to observe any of these prohibitions (eating, drinking, smoking) during the period stated above.**

Please do not forget to remove: Contact lenses, hearing aids and any other objects that can be removed from your body such as eyeglasses, necklaces, bracelets and earrings. Please do not use makeup or facial cream. Ask your anaesthetist whether loose dental pieces such as dentures, piercings, hair pieces, and polish on the finger nails or toe nails must be removed.

Post-Anaesthesiological Care:

After the medical procedure, you will be monitored until your vital functions are stable. Nausea and vomiting caused by the anaesthetic or pain killers are temporary and can generally be treated effectively.

If general anaesthesia was applied, you will still be tired and sleepy or temporarily disoriented for quite some time after you wake up. This is normal and no reason for worry.

If regional anaesthesia was applied, its effects will generally last for quite some time. During this time, sensations in the anaesthetized region and this region's ability to move on its own will be restricted. Consequently, you must take care to protect this region of your body from harm that might be caused by pressure, cold, heat or injuries.

If you were treated as an **outpatient**, an adult must pick you up when the procedure is over. You should also arrange for an adult to be with you at home to watch over you for 24 hours or for the time recommended by your physician. Your abilities to react

will be severely limited after the anaesthetic. For a period of **24 hours** after the operation, you **must not actively participate in road traffic** (not even as a pedestrian), refrain from any risky activities and avoid taking any important decisions.

Please be sure to inform your physician immediately, call up the clinic, go there or have yourself brought there in the event of complaints such as **pain while breathing, severe backache or headache, heart problems, laboured breathing, circulatory disorders, hoarseness, fever, stiff neck, cramps, tingling or numbness in the hands or feet (paraesthesia), signs of paralysis or restrictions in movement, constipation or retention of urine**. Such complaints are also possible several days after the medical procedure and must be treated immediately.

In respect to other activities such as eating and drinking, taking medications and physical exertion, you must follow the instructions of your physician. Please do not smoke or drink alcohol during the first 24 hours after the anaesthesia.

RISKS, POSSIBLE COMPLICATIONS AND SIDE EFFECTS

RISIKEN, MÖGLICHE KOMPLIKATIONEN UND NEBENWIRKUNGEN

It is well known that **any medical procedure is accompanied by certain risks**. If complications occur, they may sometimes require additional treatment or surgery and, in extreme cases, can sometimes even be **life-threatening** or lead to permanent damage – even after some time. The occurrence of side effects and complications depends on several factors, such as the patient's age, overall health, previous conditions, life style and the type and the severity of the procedure. Severe complications are very rare even in patients with serious pre-existing health problems and in elderly patients. Please understand that, for legal reasons, any possible risks associated with this procedure must be listed, even if some of these only occur in exceptional cases. For instance, painful sensations felt by the patient even despite proper anaesthetization or the patient waking from anaesthesia during the operation cannot be ruled out entirely. However, most patients will not remember such occurrences later on. During the interview, your doctor will inform you of any risks specific to your case. You may also choose to waive a detailed explanation. In that event, please pass over this section on risks and confirm your waiver with your signature in the final section of this form.

General Risks

Damage to the skin, soft tissue or nerves (for instance through injections, catheterisation, disinfectants or despite proper positioning) is possible. Numbness, paralysis and pain may then result. They are usually temporary. In some cases, permanent nerve damage, tissue death or scarring may occur.

Allergic reactions, for instance to anaesthesia or other medication, can lead to skin rash, itching, swelling, nausea and coughing. Severe reactions such as shortness of breath, spasms, tachycardia or **life-threatening circulatory shock** are rare. They may then result in permanent organ damage, such as brain damage, paralyse or kidney failure requiring dialyses.

Injury of major blood vessels near the puncture point is very rare.

Should **severe blood loss** occur, the use of donor blood/blood components (**transfusion**) may be required. In very rare cases, this can lead to transmission of diseases, such as hepatitis (causing dangerous inflammation of the liver), HIV (causing AIDS), BSE (causing a form of Creutzfeldt-Jakob disease) or also of other dangerous – even unknown – diseases. Lung oedema leading to lung failure, a decrease in kidney function or other dangerous immune responses can be triggered. A blood donation by the patient for later use if a transfusion is needed is only appropriate in certain exceptional cases. After a blood transfusion, a blood

test can be considered a few weeks later so that the possibility of infection with HIV or hepatitis viruses can be excluded with absolute certainty.

Sometimes **blood clots (thromboses)** may form, causing obstruction of a blood vessel. Such blood clots may then travel to other parts of the body and block the vessels of other organs (**embolism**). This may then lead to e.g. **lung embolism, stroke** or **kidney failure** requiring dialyses and resulting in permanent damage. If anticoagulant agents are administered to prevent formation of blood clots, the risk of bleeding or post-procedure bleeding is increased. If Heparin is administered, it may lead to a severe immune response (HIT) involving clotting of the platelets (thrombocytes) and obstruction of veins and of arteries.

Infections, for instance at the site where the injection needle or the cannula or catheter was inserted, including syringe abscess or vein inflammation (phlebitis), can usually be treated successfully with antibiotics. Surgical treatment is only necessary in rare cases. An infection that has spread beyond control can lead to **dangerous blood poisoning** (toxaemia).

Sometimes there are **bruises (haematomas)** at or near the puncture point. These can cause the formation of hard, painful swellings. Most of them vanish by themselves without treatment after a few days or weeks.

If an **urinary catheter** has to be inserted, it may lead to **infections** or **injury of the urethra**. Injuries can lead to a narrowing of the urethra (stricture), which may then require surgery. Infections can spread to the kidneys and lead to permanent damage.

Special Risks of General Anaesthesia

Under anaesthesia, the body loses its protective reflexes. For instance, the pylorus may open inadvertently. Stomach contents can then flow back into the oesophagus and enter the lungs from there. This risk especially applies if the order not to eat, drink or smoke prior to the procedure has not been followed. On very rare occasions, this may then lead to acute **obstruction of airways** and even **choking**, or **pneumonia** accompanied by permanent damage to the lungs, or even to **lung failure**.

The following complications can arise when the respiratory tube or laryngeal mask is inserted: occasional **sore throat, hoarseness** or **problems with swallowing**, which usually go away by themselves without treatment; very rare are **injuries to the throat, voice box, vocal cords** or **windpipes** with impaired sensations, laboured breathing, permanent problems with swallowing or hoarseness; **damage to or even loss of teeth** that require treatment by a dentist, especially with loose teeth, cavities, periodontitis or fixed dentures (e.g. prostheses, bridges, implants, etc.).

Occlusion of the respiratory tract caused by muscle cramps of the voice box (laryngospasms) is rare and can generally be treated immediately with good effect.

In extremely rare cases, with genetically disposed persons the body temperature can rise to a life-threatening level (**malignant hyperthermia**) when medications are administered. The result can be cardiovascular and respiratory failure and functional loss of several organs. In such cases intensive medical care is started at once to ward off these threats.

After general anaesthesia, you will feel **drowsy** or temporarily disoriented after waking. Especially in elderly patients, **disturbances of perception and consciousness** may continue for an extended period of time. **Permanent impairment of thinking, memory and orientation** may occur.

Special Risks of Regional Anaesthesia

Impaired sensations such as, for example, **feelings of heaviness or numbness, trembling muscles**, and **itching** in the anaesthetized limbs generally go away after a few weeks.

Injury of the brachial artery when the arm is anaesthetised and a resulting extension (false aneurysm) are very rare and can result in impaired sensations or even paralysis of the arm.

If an anaesthetic manages to enter the bloodstream by mistake, there can be **seizures, cardiac and/or circulatory problems** or even **loss of consciousness and respiratory failure**. In addition, there can be temporary paralyses if, with spinal anaesthesia, the anaesthetic has spread too far or, with peridural anaesthesia, the anaesthetic has gotten into the spinal canal. Then immediate intensive medical treatment is required in order to prevent permanent damage to the brain.

Further risks of spinal/epidural anaesthesia

A sharp **drop in blood pressure, pulse rate** and **laboured breathing** with nausea are usually temporary but must sometimes be treated with medication.

During puncturing, **pain** at the puncture site may occur as well as **paraesthesia** due to nerve root irritation.

There are frequently cases of temporary **urine retention, impotence** and **impairment of the rectal function**. It can be necessary to insert a bladder catheter to empty the bladder or to take other action.

Occasionally there are **severe back pains** that can last for several days. These can mostly be treated well with medication.

Sometimes there are strong **headaches** caused by the loss of cerebrospinal fluid through the puncture point at the spinal canal. In many cases these headaches go away after a while, when the patient drinks lots of fluids, takes medications and/or rests in bed. In some cases it can be necessary to inject some of the patient's own blood into the epidural space ("blood patch"). In extremely rare cases these headaches can last for years. In extreme cases there can be an accumulation of blood in part of the brain (**subdural haematoma**), an accumulation of fluids (**hygroma**) or impairment of cranial nerves. Long-lasting malfunctions such as, for example, impaired sight and hearing, are very rare. A **liquor fistula** (unnatural connection with spinal fluid leak) may form, which may then have to be closed through surgery.

Damages to the spinal cord (with epidural or spinal anaesthesia) **or to nerves** caused by injections, inserting or removing a catheter, haemorrhages, bruises or infections are very rare. This leads to temporary functional disorders of the organs affected in almost all cases, but in very rare cases these disorders can be permanent. The results can range from pain, oversensitivity, feelings of numbness and motor disturbances in the affected limbs to paralysis or even paraplegia.

In exceptional cases **meningitis** might develop and even result in permanent damage to the brain.

With anaesthetization in the area of the thoracic spine there have been very rare cases of **injury** to the **pleura** (the double-layered membrane that surrounds the lungs) with the consequence that air enters the chest and the lung is displaced so that the lung function is impaired, possible even permanently (pneumothorax). There can be pain in the chest, coughing, disquiet, outbreaks of sweat, elevated pulse and laboured breathing. The air must be sucked out through puncture or by laying drainages.

Questions about Your Medical History

Please fill in the following questionnaire carefully before your information talk. **Please tick the applicable box!** It goes without saying that your information will be treated confidentially. The information you provide will help the physician to better assess the risks of anaesthesia in your particular case, to advise you on the complications that could occur, and to take any steps needed to prevent complications and side effects.

yes=ja no=nein

Gender: M / F, age: _____ years, weight: _____ kg, height: _____ cm, occupation _____
 Geschlecht: m / w, Alter: Jahre, Gewicht: kg, Größe: cm, Beruf

Do you normally use corrective lenses (eyeglasses, contact lenses, etc.)? yes no
 Verwenden Sie normalerweise eine Sehhilfe (Brille, Kontaktlinse, etc.)?

Do you usually wear a hearing aid? yes no
 Tragen Sie gewöhnlich ein Hörgerät?

Have you recently been given medical treatment? yes no
 Wurden Sie in der letzten Zeit ärztlich behandelt?
 If so, why? _____
 Wenn ja, weswegen?

Have you been operated on before? yes no
 Wurden Sie bereits früher operiert?
 If so, when and why? _____
 Wenn ja, weswegen und wann?

Were there complications with anaesthesia or treating pain? yes no
 Ergaben sich damals bei der Anästhesie oder Schmerzbehandlung Komplikationen?
 If so, which ones? _____
 Wenn ja, welche

Have any blood relations (parents, brothers, sisters) ever experienced an unforeseen incident in connection with an anaesthetic procedure? yes no
 Kam es bei Blutsverwandten (Eltern, Geschwister) zu Zwischenfällen im Zusammenhang mit einer Anästhesie?

Have you ever received a blood transfusion? yes no
 Haben Sie schon einmal eine Bluttransfusion erhalten?
 If so, when? _____
 Wenn ja, wann?

Were there any complications? yes no
 Ergaben sich dabei Komplikationen?

Medical Documentation of the Pre-Operative Explanatory Appointment

Ärztl. Dokumentation zum Aufklärungsgespräch

To be filled in by the physician Wird vom Arzt ausgefüllt

Über folgende Themen (z.B. mögliche Komplikationen, die sich aus den spezifischen Risiken beim Patienten ergeben können, nähere Informationen zu den Alternativ-Methoden, mögliche Konsequenzen, wenn die Anästhesie verschoben oder abgelehnt wird) habe ich den Patienten im Gespräch näher aufgeklärt:

I have proposed: Vorgeschlagen habe ich:

- General anaesthesia Allgemeinanästhesie local anaesthesia Lokalanästhesie
 lumbular epidural lumbale PDA thoracic epidural thorakale PDA
 spinal anaesthesia SPA
 axillary brachial plexus block (armpit) Axilläre Plexusanästhesie

Pre-operative food and drink: Anweisung zum Nüchternheitsgebot:

- no solid food after _____ o'clock on the day before the procedure keine feste Nahrung ab ____ Uhr am Vortag des Eingriffs
 no food, beverages or alcohol after _____ o'clock on the day of the procedure keine Nahrung, Getränke, Alkohol ab ____ Uhr am Tag des Eingriffs
 nothing, not even clear liquids, after _____ o'clock on the day of the procedure keine klare Flüssigkeit ab ____ Uhr am Tag des Eingriffs

Patient's ability to take an independent decision on granting consent: Fähigkeit der eigenständigen Einwilligung:

- The patient is of **legal age** and is capable of making an independent decision regarding the recommended treatment/examination and giving his/her consent to the procedure. Die Patientin/Der Patient ist **volljährig** und besitzt die Fähigkeit, eine eigenständige Entscheidung über die empfohlene Maßnahme zu treffen und ihre/seine Einwilligung in das Verfahren zu erteilen.
- The **minor's** ability to reason and power of judgement are sufficient. Therefore, his/her consent/rejection and that of the parents/legal guardian are required. Die/Der **Minderjährige** verfügt über hinreichende Einsichts- und Urteilsfähigkeit, weshalb ihre/seine Zustimmung/Ablehnung und die der Eltern/des Vormunds eingeholt werden.
- The patient is represented by a **custodian** with a custodian's card which states that he/she is also responsible for the patient's healthcare, or by a trusted person with a healthcare proxy. The child is represented by a parent/both **parents** or a legal guardian. These persons are capable of making a decision in the best interest of the patient/the child. Die Patientin/Der Patient wird von einem **Betreuer** mit einem die Gesundheitsorge umfassenden Betreuerausweis oder einer Vertrauensperson mit einer Vorsorgevollmacht bzw. das Kind von seinen **Eltern**/einem Elternteil oder einem Vormund vertreten. Diese sind in der Lage, eine Entscheidung im Sinne des Patienten/des Kindes zu treffen.
- Custodian's card healthcare proxy advance healthcare directive has been submitted.
- Betreuerausweis Vorsorgevollmacht Patientenverfügung liegt vor.

Patient's Refusal Ablehnung des Patiententhe

The doctor _____ has provided me with detailed information regarding the procedure at hand and has also pointed out the disadvantages of rejecting it. I have understood the information provided to me and reject the anaesthesia procedure suggested to me. Die Ärztin/der Arzt hat mich umfassend über die vorgeschlagene Betäubungsart und über die sich aus meiner Ablehnung ergebenden Nachteile aufgeklärt. Ich habe die diesbezügliche Aufklärung verstanden und lehne die mir vorgeschlagene Anästhesie ab.

Patient's Declaration and Consent

Erklärung und Einwilligung des Patienten

Please mark the applicable boxes and then confirm the resulting declaration with your signature. Bitte kreuzen Sie Ihre Erklärung im zutreffenden Kästchen an und bestätigen Sie diese anschließend mit Ihrer Unterschrift:

- I hereby confirm that I have understood all the parts this explanation for patients.** I have read the entire form (7 pages). During the pre-procedure interview with the doctor _____ I was given a comprehensive explanation of the anaesthetic procedure planned for me, its risks and possible complications and side effects in my case, and its advantages and disadvantages relative to alternative methods of anaesthesia. **Ich bestätige hiermit, dass ich alle Bestandteile der Patientenaufklärung verstanden habe.** Diesen Aufklärungsbogen (7 Seiten) habe ich vollständig gelesen. Im Aufklärungsgespräch mit der Ärztin/dem Arzt wurde ich über den Ablauf des geplanten Betäubungsverfahrens, dessen Risiken, Komplikationen und Nebenwirkungen in meinem speziellen Fall und über die Vor- und Nachteile der Alternativmethoden umfassend informiert.
- I have seen and understood the film about the anaesthetic procedure that has been planned for me. Den Informationsfilm über die bei mir geplante Betäubung habe ich gesehen und verstanden.
- I deliberately refrain from obtaining a more detailed explanation.** However, I hereby confirm that the doctor _____ instructed me regarding the necessity of anaesthesia, its type and scope as well as the fact that all anaesthesia procedures are accompanied by certain risks. **Ich verzichte bewusst auf eine ausführliche Aufklärung.** Ich bestätige hiermit allerdings, dass ich von der Ärztin/dem Arzt über die Erforderlichkeit der Betäubung, deren Art und Umfang sowie über den Umstand, dass alle Betäubungsverfahren Risiken bergen, informiert wurde.

I affirm that I do not need any more time in which to think the matter over and that I consent to the proposed anaesthetic procedure.

I answered the questions about my medical history to the best of my knowledge and belief. I also approve all required auxiliary and follow-up measures (e.g. injections, monitoring, etc.). **Ich versichere, dass ich keine zusätzliche Bedenkenzeit benötige und dass ich dem vorgeschlagenen Betäubungsverfahren zustimme.** Die Fragen zu meiner Krankengeschichte (Anamnese) habe ich nach bestem Wissen vollständig beantwortet. Ich willige ebenfalls in alle notwendigen Neben- und Folgemaßnahmen (z.B. Einspritzungen, Überwachungsmaßnahmen) ein.

- My approval also covers any required changes or extensions of the anaesthetic procedure, e.g. in case of regional **anaesthesia**, the continuation of the medical procedure under general anaesthesia and/or the combination with an other regional or local anaesthetic procedure. Meine Einwilligung bezieht sich auch auf die erforderlichen Änderungen oder Erweiterungen des Verfahrens, z.B. bei einer Regionalanästhesie die Fortführung in Narkose, Kombination mit einem anderen örtlichen Betäubungsverfahren.
- In the event that the anaesthetic effect of regional anaesthesia is not sufficient, I do not wish to be put under general anaesthesia; rather, I prefer that regional anaesthesia be tried again at a later time. Falls bei einer Regionalanästhesie die Betäubung nicht ausreichen sollte, wünsche ich keine Narkose, sondern einen erneuten Versuch zur örtlichen Betäubung zu einem späteren Zeitpunkt.

I affirm that I am in a position to follow the medical advice I have received. Ich versichere, dass ich in der Lage bin, die ärztlichen Verhaltenshinweise zu befolgen. If treatment is subject to an elective service agreement (referred to as treatment by senior consultant), the patient's consent also applies to the procedures being carried out by the senior consultant's permanent representatives as specified in the elective service agreement. Im Falle einer Wahlleistungsvereinbarung (sog. Chefarztbehandlung) erstreckt sich die Einwilligung auch auf die Durchführung der Maßnahmen durch die in der Wahlleistungsvereinbarung benannten ständigen ärztlichen Vertreter des Wahlarztes.

- I agree that my copy of this explanatory form may be sent to the following e-mail address: Ich bin damit einverstanden, dass meine Kopie dieses Aufklärungsbogens an folgende E-Mail-Adresse gesendet wird:

E-mail-address [E-Mail-Adresse]

Place, Date, Time [Ort, Datum, Uhrzeit]
